

# Morbidity and Mortality

Weekly Report

PUBLIC HEALTH SERVICE

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

Prepared by the NATIONAL OFFICE OF VITAL STATISTICS Executive 3-6300, Ext. 4744

For release May 23, 1958

Washington 25, D. C.

Vol. 7, No. 20

## Provisional Information on Selected Notifiable Diseases in the United States and on Deaths in Selected Cities for Week Ended May 17, 1958

### EPIDEMIOLOGICAL REPORTS

#### Nocardia asteroides

Dr. Thomas S. Hosty, Alabama State Department of Health, has reported that in the last 5 months 29 isolations of Nocardia asteroides have been made from sputa sent for routine culturing for tuberculosis. Primary isolations were accomplished on Löwenstein media and occasionally on blood agar-penicillin base. All isolations have been confirmed by Dr. L. Ajello of the Communicable Disease Center. Approximately half of the isolations have been made on patients with laboratory and clinical diagnoses of tuberculosis. The others have been made on patients in whom tuberculosis had been excluded by appropriate tests. Epidemiological data are being accumulated to assess the significance of such isolations.

#### Botulism

The Kentucky State Department of Health has forwarded a report of an outbreak of botulism in 2 persons in a family of 4 who lived as scavengers under extremely primitive conditions. On April 29, 1958, the mother of the family obtained by begging 4 or 5 jars of canned beans, which had been discarded as spoiled by the woman who had canned them by the water-bath method in 1956. The liquid in the jars appeared milky. On April 30 a jar of beans was prepared for luncheon by heating in a skillet. The 15-year-old son and 14-year-old daughter tasted but did not swallow the beans. Only the mother and the 4-year-old son ate the beans. About 10 hours later the mother became ill, drank 3 glasses of warm salt water and vomited. The 4-year-old boy complained of a sore throat. The following day

COMMUNICABLE DISEASE CENTER

LIBRARY

50 SEVENTH STREET N. E.

ATLANTA 23, GEORGIA

## EPIDEMIOLOGICAL REPORTS—Continued

the mother had difficulty in swallowing and had stomach pains; and the boy complained of choking. On May 2 both of them were still ill and were treated with penicillin. The following day both patients were hospitalized. The mother's symptoms included dizziness, loss of speech, diplopia, loss of pupillary reflex, sore throat, extreme difficulty in swallowing, and muscular weakness. By May 8 the mother had received 100,000 units of botulinus antitoxin and the boy, 80,000 units. Both patients still had difficulty in swallowing, and the mother still had diplopia, although her speech was returning to normal. Laboratory examination of 1 of the unopened jars of beans revealed Clostridium botulinum.

Psittacosis

Information has been received from Dr. A. C. Hollister, California Department of Public Health, of 2 cases of psittacosis in a 79-year-old woman and her 50-year-old daughter-in-law. The older woman suffered from chills, anorexia, shoulder pain, pain on breathing, cough, and a fever of 105° F. In 1 case complement fixation tests employing psittacosis antigen showed a titer rise from less than 1:8 to 1:16 within 1 week. Both women had been exposed to 4 pet parakeets. Laboratory examination of the 4 birds revealed that 2 of them were infected with psittacosis.

Insecticide poisoning

The Kentucky State Department of Health has reported a gastro-enteric illness in 20 of 366 persons who ate luncheon in a school cafeteria. The 20 children who became ill with nausea, vomiting, fever, and headache were the only persons eating in the cafeteria when it was sprayed with an insecticide containing pyrethrin, dieldrin, N-octyl sulfoxide of isosafrole, phenyl mercuric lactate, polymerized glycerol oleate, and petroleum distillates. The spraying took place about 10 to 12 feet from the table where the children were eating. One of the children who became ill had brought his lunch from home and was eating with the group at the time of the spraying. One of the children was hospitalized. Most of them were back in school the following day. No food samples were available for examination.

## QUARANTINE MEASURES

Immunization Information for International Travel

Public Health Service Publication No. 384

Asia.—Pakistan (Supplement, p. 15) now requires cholera vaccination of all arrivals from infected areas. All other information remains the same.

<sup>1</sup>Data exclude report from Pennsylvania for the current week.

<sup>2</sup>Data exclude report from Puerto Rico for the current week.

Symbols.—1 dash [-]: no cases reported; 3 dashes [---]: data not available; asterisk [\*]: disease not notifiable.

The chart shows the number of deaths reported for 114 major cities of the United States by week for the current year, a 5-week moving average of these figures plotted at the central week and an adjusted average, 1953-57, for comparison. The adjusted average is computed as follows: From the total deaths reported each week for the years 1953-57, 3 central figures are selected by eliminating the highest and lowest figures reported for that week. A 5-week moving average of the arithmetic means of the 3 central figures is then computed. The adjusted average shown in the chart is the 5-week moving average increased by 2.3 percent to allow for estimated population growth in the cities.

The use of the adjusted average is based on the assumption that the crude death rate and changes in population will remain at the level of recent years. No allowance has been made for increased use of city hospital facilities.

Table 4 shows the number of death certificates received during the week indicated for deaths that occurred in a specified city. Figures compiled in this way, by week of receipt, usually approximate closely the number of deaths occurring during the week. However, differences are to be expected because of variations in the interval between death and receipt of the certificate and because of incomplete reporting due to holidays or vacations. If a report is not received from a city in time to be included in the total for the current week an estimate is made for use in plotting the figure in the chart.

The number of deaths in cities of the same size may also differ because of variations in the age, race, and sex composition of the populations, and because some cities are hospital centers serving the surrounding areas. Changes from year to year in the number of deaths may be due in part to population increases or decreases.

# Morbidity and Mortality Weekly Report

## SOURCE AND NATURE OF MORBIDITY DATA

These provisional data are based on reports to the Public Health Service from health departments of each State and of Alaska, Hawaii, and Puerto Rico. They give the total number of cases of certain communicable diseases reported during the week usually ended the preceding Saturday. Cases of anthrax, botulism, and rabies in man are not shown in table 2, but a footnote to table 1 shows the States reporting on these diseases. In addition, when diseases of rare occurrence (cholera, dengue, plague, louse-borne relapsing fever, smallpox, louse-borne epidemic typhus, and yellow fever) are reported, this will be noted at the end of table 1.
